Making Better Drivers For Tomorrow!

THREE POINT TURN

A three-point turn is a maneuver performed on every road test. Its primary purpose is to demonstrate the driver's awareness of the vehicle's position— avoiding contact with or driving over the curb— and maintaining full awareness of the surroundings in all directions.

The two most important aspects of a successful three-point turn are proper observation and signaling. These must be performed at each stage of the maneuver to ensure it is safe to proceed.
